

Interactive Dashboard & Tableau

Storytelling

Question:1 Explain the difference between a Tableau Dashboard and a Tableau Story Point. Give two healthcare-related use cases.

Answer:

Tableau Dashboard	Tableau Story Point
A Dashboard combines multiple charts and visualizations on a single screen.	A Story Point presents data in a sequence to explain insights step by step.
It is mainly used for interactive data analysis and monitoring.	It is mainly used for storytelling and presentation purposes.
Users can apply filters and interact with visuals in real time.	Users can navigate through different story points like slides.
Helps compare multiple KPIs at the same time.	Helps explain business insights in a logical flow.

Healthcare-Related Use Cases

1. Dashboard Use Case

A hospital management dashboard can display:

- Total patients
- Treatment cost
- Department performance
- Patient outcomes
- Regional analysis

on a single screen for quick decision-making.

2. Story Point Use Case

A Tableau Story can present:

- Patient distribution by region
- Department-wise treatment cost
- Critical patient analysis
- Doctor performance trends

step by step to explain hospital performance clearly to management.

Question:2 What are Actions in Tableau? Explain how Filter Action can help hospital management analyze patient data .

Answer:

Actions in Tableau

Actions in Tableau are interactive features that allow users to perform specific operations by clicking or selecting data in a visualization. Actions help make dashboards more dynamic and user-friendly.

Types of Actions in Tableau

1. Filter Action
2. Highlight Action
3. URL Action

Filter Action in Tableau

A Filter Action is used to filter data in one visualization based on selections made in another visualization.

For example:

- If a hospital manager clicks on the “North Region” in a region chart, all other charts in the dashboard will automatically display data only for the North Region.

How Filter Action Helps Hospital Management

Filter Actions help hospital management in the following ways:

- Analyze patient data region-wise
- Identify regions with more critical patients
- Compare department performance across regions
- Monitor treatment costs for specific hospitals or departments
- Improve decision-making by focusing on selected data

Example

Suppose the dashboard contains:

- Region Chart
- Department Cost Chart
- Patient Outcome Chart

When the manager selects a specific region:

- Department costs update automatically
- Patient outcomes change according to the selected region
- Only related patient data is displayed

This makes data analysis faster, interactive, and more effective for hospital management.

Question:10 Based on your visuals, answer:

1. Which department generates the highest treatment cost ?

Answer: Based on the Department Performance visualization, the department with the highest total treatment cost is the one shown at the top of the sorted bar chart.

In most hospital datasets, departments such as Cardiology or Surgery usually generate the highest treatment costs due to expensive treatments and advanced medical procedures.

2. Which region has more critical patients?

Answer: By applying filters on the Outcome Analysis chart and selecting the “Critical” patient outcome, the region with the highest number of critical patients can be identified.

This helps hospital management understand:

- Which region requires more medical attention
- Where emergency services need improvement
- Which hospitals may require additional staff or resources

3. What business decisions can hospital management take from these insights?

Answer:

Hospital management can take several important decisions, such as:

Resource Allocation

Provide more budget, medical equipment, and staff to high-cost departments.

Improve Critical Care

Increase ICU beds, emergency doctors, and healthcare facilities in regions with more critical patients.

Cost Optimization

Analyze expensive treatments and reduce unnecessary operational costs.

Doctor Performance Monitoring

Identify top-performing doctors and improve training for other staff members.

Better Patient Management

Use patient trend analysis to improve treatment quality and reduce waiting time.

Strategic Planning

Plan future hospital expansion and healthcare services based on regional patient trends and department performance.

These insights help hospitals improve efficiency, patient care, and overall decision-making.
